JQuery Ajax

The other methods that are available in jQuery to make ajax requests are load(), get(), post(). All theses methods are wrapper methods and uses ajax() method under the hood.

```
$.ajax({
    url: 'GetHelpText.aspx',
    data: { HelpTextKey: helpDiv },
    method: 'post',
    dataType: 'xml',
    success: function (response) {
       var jQueryXml = $(response);
       var textElement = jQueryXml.find("Text");
       $('#' + helpDiv + 'HelpDiv').html(textElement.text());
    }
});
```

Calling WCF services using jquery ajax

Demo

```
□using System;
                                           using System.Collections.Generic;
                                           using System.Linq;
                                           using System.Web;
                                          ⊟namespace Demo
                                           {
Create procedure spGetEmployeeById
                                          public class Employee
@Id int
as
                                                    public int ID { get; set; }
Begin
    Select ID, Name, Gender, Salary
                                                    public string Name { get; set; }
    from tblEmployee
                                                    public string Gender { get; set; }
    where ID = @Id
                                                    public int Salary { get; set; }
End
                                               }
Execute spGetEmployeeById 2
```

Demo.Employee

```

</script>
```

If contentType is mentioned then data that we have to pass to the server is json string. So data have to be sent in JSON.stringify({}).

datatype is json so in service return type would be void, we don't have to return any object.

```
JavaScriptSerializer js = new JavaScriptSerializer();
Context.Response.Write(js.Serialize(employee));
```

This is the json string output: {"ID":1, "Name": "Mark", "Gender": "Male", "Salary": 50000}

When content type is not used: the return type of the service would be class object.

- 1. contentType option is no longer required, so you may remove it
- 2. You don't have to convert the data that you are sending to the server to JSON string
- 3. The JSON object returned from the server will not have property d

```
$(document).ready(function () {
    $('#btnGetEmployee').click(function () {
         var empId = $('#txtId').val();
         $.ajax({
             url: 'EmployeeService.asmx/GetEmployeeById',
             data: { employeeId: empId },
             dataType: "json",
             method: 'post',
             success: function (data) {
                 $('#txtName').val(data.Name);
                 $('#txtGender').val(data.Gender);
$('#txtSalary').val(data.Salary);
             },
             error: function (err) {
                 alert(err);
             }
        });
    });
});
```
